Does "Science" Make You Moral?

The Effects of Priming Science on Moral Judgments and Behavior

Christine Ma-Kellams, Jim Inzlicht

Department of Psychology and Brain Sciences, University of California Santa Barbara, Santa Barbara, California, United States of America

Abstract

Previous work has noted that science stands as an ideological force insofar as the answers it offers to a variety of fundamental questions and concerns. As such, those who pursue scientific inquiry have been shown to be concerned with the moral and social ramifications of their scientific endeavors. No studies to date have directly investigated the links between exposure to science and moral or prosocial behaviors. Study 1 ($n = 76$) tested the nature of the connection between exposure to science and likelihood of inferring moral norms. Studies 2 ($n = 49$), 3 ($n = 52$), and 4 ($n = 43$) manipulated thoughts about science and examined the causal impact of such thoughts on imagined and actual moral behavior. Across studies, thinking about science had a moralizing effect on a broad array of domains, including interpersonal violations (Studies 1, 2), prosocial intentions (Study 3), and economic exploitation (Study 4). These studies demonstrated the morally normative effects of lay notions of science. Thinking about science leads individuals to endorse more stringent moral norms and exhibit more morally normative behavior. These studies are the first of their kind to systematically and empirically test the relationship between science and morality. The present findings speak to this question and elucidate the value-laden outcomes of the notion of science.
